3 min read · Apr 4, 2023

Customer feedback analysis is important because it helps companies understand what their customers think about their products or services. By listening to customer feedback, companies can find out what they are doing well and what they need to improve. This helps companies make changes to make their customers happier and keep them coming back. By doing this, companies can stand out from their competitors and have a better reputation.

Customer feedback analysis can be used to extract a wide range of information from text data.

1. **Sentiment analysis:** Determining the overall sentiment (positive, negative, or neutral) expressed in a text.
2. **Entity recognition:** Identifying named entities (such as people, places, organizations, and products) mentioned in the text.
3. **Topic modeling:** Identifying the topics or themes discussed in a text.
4. **Text classification:** Categorizing text into predefined categories based on the content.

5. Summarization: Generating a concise summary of a longer text.

We can use Text Analysis in various fields, such as **marketing**, **customer feedback analysis**, **social media monitoring**, and **content analysis**. It allows organizations to extract valuable insights from large amounts of unstructured data, which can inform business decisions, identify areas for improvement, and measure the effectiveness of marketing campaigns, among other things.

The rise of NLP(**Natural Language Processing**) offers the right tools for text analysis that involves using computer algorithms and machine learning techniques to process and analyze natural language text data. NLP allows computers to understand and interpret human language, including the context, sentiment, and meaning of the text. The only drawback of this solution is that, so far, systems are not performant enough to understand the sarcastic nuances present in negative comments.

For each of the extracted texts from the article, perform textual analysis and computed variables.

1. Sentiment Score (*A metric for measuring customer sentiment*)
2. Positive Score (*The score indicates how positive the overall text analyzed is*)
3. Negative Score (*The score indicates how negative the overall text analyzed is*)

4. **Polarity Score** (*Polarity refers to the overall sentiment conveyed by a particular text, phrase, or word. This polarity can be expressed as a numerical rating known as a “sentiment score”. For example, this score can be a number between -100 and 100 with 0 representing neutral sentiment.*)
5. **Subjectivity Score** (*Subjectivity score lies between (0 and 1), It shows the amount of personal opinion. If a sentence has high subjectivity i.e. close to 1, It resembles that the text contains more personal opinion than factual information.*)
6. **Complex Word Count** (*A word consisting of a base and one or more derivational elements: unlikely (un-, like, -ly); vitality (vit-, -al, -ity).*)
7. **Fog Index**
8. **Avg. Word Length**
9. **Avg Sentence Length**
10. **Avg. Number of words per sentence**
11. **Syllable per Word** (*A **syllable** is part of a word that contains a single vowel sound and that is pronounced as a unit. So, for example, ‘book’ has one syllable, and ‘reading’ has two syllables.*)
12. **Personal Pronouns**
